

Subject Description Form

Subject Code	AAE5304
Subject Title	Safety, Reliability and Airworthiness Requirement for Low-altitude Aerial Vehicle
Credit Value	3
Level	5
Pre-requisite/ Co-requisite/ Exclusion	Nil
Objectives	This subject aims at to equip students with the knowledge and skills necessary to navigate the complex lower airspace ecosystem. Students will gain a comprehensive understanding of the regulatory framework, stakeholder interests, reliability analysis and safety considerations governing lower airspace operations. The programme will explore into legal and regulatory frameworks, stakeholder interests, reliability analysis ,safety assessment methodologies for UAVs and other low-altitude aircraft, incident and accident investigation principles, and aerial vehicle certification requirements and airworthiness considerations. Upon completion, students will be prepared to contribute meaningfully to the development and safe integration of low-altitude aviation technologies.
Intended Learning Outcomes	Upon completion of the subject, students will be able to: - Analyse the legal and regulatory framework governing lower airspace operations, identifying key challenges and opportunities for innovation. This includes understanding the role of various stakeholders and the impact of emerging technologies on airspace management; - Apply reliability analysis techniques to assess and improve the reliability of low-altitude aerial vehicle systems and components - Design and implement effective safety assessment protocols for unmanned aerial vehicles (UAVs) and other low-altitude aircraft, ensuring compliance with regulatory standards and mitigating potential risks. This includes applying risk assessment methodologies and developing safety procedures to ensure safe and responsible operations; and - Apply investigative techniques, analysing data, and communicating findings to relevant stakeholders.
Subject Synopsis/ Indicative Syllabus	<u>Lower Airspace Regulation and Policy</u> - introduce the lower airspace environment, explore legal and regulatory frameworks governing operations, delve into international standards and best practices, examine airspace management and access, and analyse policy and economic considerations. <u>Stakeholder Interests and Collaboration</u> - focus on analysing the diverse interests of stakeholders involved in lower airspace activities, including operators, manufacturers, regulators, and communities. Students will explore industry perspectives, regulatory perspectives, community concerns, and collaboration strategies for successful integration. <u>Certification and Manufacturing in UAV/eVTOL Development</u> -introduce overview of manufacturing techniques of low- altitude aerial vehicle, understand regulatory frameworks and type certification requirements <u>Reliability and Maintainability Analysis</u> – introduce Reliability analysis

	<u>techniques: Failure Mode and Effects Analysis (FMEA), Weibull Analysis and Reliability Block Diagram approach. Students will be able to determine the life behaviour of a low- altitude aerial vehicle component , calculate the failure rate of a low-altitude aerial vehicle system and provide a cost effective predictive maintenance solutions.</u> <u>Safety Assessment and Risk Management</u> - equip students with the skills to conduct thorough safety assessments for unmanned aerial vehicles (UAVs) and other low-altitude aircraft. Topics covered include safety management systems, risk assessment and mitigation, human factors in aviation safety, operational safety procedures and standards, and safety data analysis and reporting. <u>Incident and Accident Investigation</u> - prepare students to effectively investigate incidents and accidents in the lower airspace. Students will learn the principles of accident investigation, data collection and analysis, human factors in accidents, safety recommendations and implementation, and review case studies and best practices.																																	
Teaching/Learning Methodology	Lectures are used to deliver the knowledge of compliance topics to the students. Case study coupled with group presentations will be used to foster students’ understanding of the subject matters. <table><tr><th rowspan="2">Teaching/Learning Methodology</th><th colspan="4">Outcomes</th></tr><tr><th>a</th><th>b</th><th>c</th><th>d</th></tr><tr><td>Lecture</td><td>✓</td><td>✓</td><td>✓</td><td>✓</td></tr><tr><td>Case study</td><td></td><td>✓</td><td>✓</td><td></td></tr><tr><td>Group presentation</td><td></td><td>✓</td><td>✓</td><td>✓</td></tr></table>	Teaching/Learning Methodology	Outcomes				a	b	c	d	Lecture	✓	✓	✓	✓	Case study		✓	✓		Group presentation		✓	✓	✓

	Formal examinations will assess students' knowledge of relevant regulations, maintenance procedures, and basic airworthiness concepts. Students will engage in self-directed learning through case study reports, analyzing real-world scenarios related to safety incidents and reliability issues involving low-altitude aerial vehicles. This fosters critical thinking and problem-solving skills. This combination of assessment methods ensures a well-rounded learning experience, combining theoretical knowledge with practical application and real-world insights.	
Student Study Effort Expected	Class contact:	
	▪ Lecture	33 Hrs.
	▪ Tutorials	6 Hrs.
	▪ Other student study effort:	
	▪ Assignments	20 Hrs.
	▪ Report	60 Hrs.
	Total student study effort	119 Hrs.
