

Subject Description Form

Subject Code	EEE503
Subject Title	Microphotonics and Quantum Photonic Systems
Credit Value	3
Level	5
Pre-requisite/ Co-requisite/ Exclusion	Nil
Objectives	This subject aims to bring in-depth treatment of fundamental concepts behind light propagation in various photonic components and quantum devices. Focusing on the basic underlying theory of silicon photonics and quantum, and description of different quantum photonic devices and systems. Applications are briefly described.
Intended Learning Outcomes	Upon completion of the subject, students will be able to: Category A: Professional/academic knowledge and skills - Understand the waveguides and basic waveguide-based components. - Understand the basic operation of the most important passive and active photonic components. - Understand the basic operation of quantum devices and systems. Category B: Attributes for all-roundedness - Communicate effectively. - Think critically and creatively. - Assimilate new technological development in related field
Subject Synopsis/ Indicative Syllabus	Introduction of microphotonics: Understanding of the behavior of light propagation through structures with small features of the order of the wavelength of light. Matrix descriptions of wave propagation: Transfer matrices and representation of light polarization, Jones matrices. Thin films: Reflection and transmission of layered media: transfer matrix method and coatings. Fourier optics: Diffraction theory: Fresnel and Fraunhofer, Fourier transform properties of lenses. Dielectric waveguides: Theory of slab and stripe waveguide. Waveguide structures: bends, junctions, and couplers. Photonic components and quantum devices: Light modulators (electro-optical, thermo-optical), Polarisation components, Optical switching, and Single photodetectors. Microphotonic measurement and device characterization: MZI modulator, Fabry-Perot, FTIR, grating.

Teaching/Learning Methodology	The basic concepts of photonic structures and components will be introduced in lectures. The basic numerical analysis methods will be discussed. At the end of this subject, the student will be able to understand the behavior of a variety of photonic structures, components, and systems on the basis of how light propagates through them. The student will also be able to solve wave propagation problems with generic solutions. Students will also be required to study one of the photonic devices and share their findings with other classmates through presentations.
