

Subject Description Form

Subject Code	ITC6866RT
Subject Title	Guided Study in Colour Science & Technology
Credit Value	3
Level	6
Pre-requisite / Co-requisite / Exclusion	Nil
Objectives	This subject is designed for the research students who are interested in the in-depth knowledge of colour science and state-of-the-art colour technology
Intended Learning Outcomes	Upon completion of the subject, students will be able to: - learn the principle of human colour vision in relation to colour perception - have a sound knowledge on CIE colorimetry system - describe and apply advanced colour difference formulae and its parametric effects in colour evaluation and colour control and colour appearance under different viewing conditions - describe colour reproduction and application in fashion industry and other colour related industries and its theoretical background - apply colour communication and colour management across the fashion supply chain
Subject Synopsis/ Indicative Syllabus	- Human colour vision Human colour perception and its interaction with light and objects of various media and surface conditions, phenomena related to the human colour perception, defective colour visions and its identification. - CIE colorimetry system CIE standard illuminants and observers, CIE colour specification system, CIE uniform colour space, Instrumental colour measurement and its optical arrangements. - Colour difference evaluation and colour appearance Visual and instrumental colour quality evaluation using respective methods such as grey scale and colour difference formulae, colour tolerance and its establishment, parametric effects on colour difference, colour appearance and its influence by various factors as well as its applications in colour evaluation and colour presentation - Colour Communication under multi-media environment and colour reproduction Colour communication via various colour systems and under multi-media environment, colour reproduction of physical objects based on Kubelka-Munk theory, colour reproduction of self-luminous objects in modern display devices, such as flat panel display.

Teaching/Learning Methodology	Self-learning under the guidance will be adopted, literature related to the subject matters will be introduced, experiments are required to be conducted covering the various topics focused by the subject, data analysis and interpretation of the experimental results are important as well as the presentation of the experimental and learning outcomes.							
Assessment Methods in Alignment with Intended Learning Outcomes	Specific assessment methods/tasks	% weighting	Intended subject learning outcomes to be assessed					
			a	b	c	d	e	
	1. Coursework	45%	✓	✓	✓	✓	✓	
	2. Examination	55%	✓	✓	✓	✓	✓	
	Total	100%						
	Explanation of the appropriateness of the assessment methods in assessing the intended learning outcomes: Examination and course work which are based on design and conducting the experimental works can provide independent thinking and problem solving experience to students to understand and apply the subject matter. The materials submitted for this assessment must be the student’s own work. The submitted work may not be accepted for the purpose of assessment if its authenticity is questionable. Submitting GenAI-generated materials as students’ own work or part of their work is an act of academic dishonesty. Students who are found committing academic dishonesty will face disciplinary actions.							
Student Study Effort Expected	Class contact:							
	▪ Tutorials					22 Hrs		
	▪ Student Presentation					4 Hrs.		
	Other student study effort:							
	▪ Self-learning					60 Hrs.		
	▪ Assignment and Laboratory					34 Hrs.		
	Total student study effort					120 Hrs.
